Dropnest

Release notes - platform version 2.3 (November 2026)

Uploads

Resumable uploads now survive a full page reload in Chrome and Safari.

The chunk size auto-tunes between 4 and 16 MB depending on measured RTT.

Fixed a case where files above 1.7 GB failed validation on the free tier.

Links and expiry

Expiry can now be set in hours as well as days.

Password-protected links return a 401 challenge page instead of a redirect.

Download counters are deduplicated per IP for a 30-minute window.

API

Added GET /api/v1/usage with per-day bandwidth breakdown.

Rate limit headers are now returned on 429 responses as well.

Token scopes: upload-only tokens are now supported.

Web interface

Reworked the transfer page for better contrast and larger touch targets.

Browse view: added sort by size and a type filter that persists in the URL.

Reduced initial CSS payload by roughly 18 percent.

Infrastructure

Edge nodes in Frankfurt and Stockholm moved to the new storage tier.

Median time to first byte on downloads improved to 41 ms in Europe.

Nightly integrity checks now verify a random 2 percent sample of objects.

Known issues

Very long file names may wrap awkwardly on narrow screens.

The API returns UTC timestamps without an offset in one legacy endpoint.
